THE ORIGINAL KUGLER KS1515

Low Salt Starter with
Slow Release Nitrogen

KUGLER KS1515

Get top performance with balanced nutrients and slow release nitrogen.

A superior nutrient blend with great flexibility.

Kugler KS1515 contains a balanced blend of phosphate, potash and quick and slow release nitrogen. It's a perfect choice for helping your crop get up and growing fast or anytime during your crop's development when a supplementary boost of nutrients is needed.

Designed for a wide variety of crops, Kugler KS1515 can be applied foliar or in furrow. You can also use it as a concentrate or diluted for ground and aerial applications. KS1515 allows you to provide the essential nutrients your crop needs when it needs them.

Slow release nitrogen for maximum performance.

The slow release nitrogen component of Kugler KS1515 helps reduce leaching and volatilization of nitrogen. It keeps this essential nutrient in place—staying on the job in furrow and foliar applications for up to twelve weeks. This means your crop gets the quick boost of nutrients it needs and sustained nitrogen availability for improved performance.

Compatible with a variety of nutrients.

Kugler KS1515's low salt index, nutrient uniformity and soluble form make it an ideal choice to blend with micronutrient and other products to create custom fertilizers. Formulated for maximum tissue adhesion, KS1515 coats the plant's leaves and stays put. In addition, foliar feeding stimulates plant growth, even at times of stress.

See the difference.

You can tell simply by looking which acres were treated with Kugler KS1515. In furrow treatment gets crops off to a quicker start, even in less than ideal weather conditions. Foliar applications, with or without crop protection chemicals, help the plant deal with mid- or late-season stress and finish strong. Regardless of the application—in furrow or foliar—you'll also see the difference in yields.
